

Fig S5. Primary normal hepatocytes do not activate TCR-Ts. (A). WB analysis of AFP and ENPP1 in the primary hepatocytes, HepG2, and MDA-MB231. GAPDH was also detected as control. (B) ELISA assay of IFN γ in the coculture media of TCR-Ts and different hepatocytes. Compared to mock-T cells, TCR-Ts were not activated by hepatocytes and MB231 cells, but could be highly activated by HepG2 cells.
